# Plate Quality Review Procedure

Document ID: Q-PLATE-02 | Product: P-PLATE01 | Revision: 1.0

Issued: October 1, 2026 | Publisher: Blessed IT Solution Pvt Ltd

Fictional quality procedure for the hackathon only. It is not an operating instruction for a real factory.

## Purpose and prerequisites

This procedure applies only to product P-PLATE01 and complements Q-PLATE-01 revision 1.0. The Supervisor reviews the incident created from a completed Defective inspection. The required reference set consists of both plate procedures.

## Review checklist

- Confirm that the product and inspection references match the saved image and original model output.
- Review the proposed item-level hold and evidence collected under Q-PLATE-01.
- Read the cited passages and verify that each proposed action applies to this product and is supported by the documents.
- Check for missing references, unreadable images, unsupported claims, and any recorded human correction.

## Decision options

Approved for follow-up means the documented evidence is sufficient to proceed with the suggested review or evidence-collection actions. The Supervisor must add a comment explaining the decision. This status does not certify the item as Normal and does not authorize product release.

Needs more information means the record or evidence is incomplete or the proposed actions are unsupported. The Supervisor comment must identify the missing information or the reason for disagreement. Keep the incident available for manual review.

# Incomplete Evidence and Record Keeping

## When evidence is missing

If either required plate procedure is unavailable, the mapping cannot identify the required references, or no relevant passage supports a recommendation, mark the evidence Insufficient. Do not substitute another product's procedure. Request manual quality review and identify the missing source or evidence.

An incident with Insufficient evidence cannot receive Approved for follow-up. The permitted review decision is Needs more information. If evidence is later supplied, a new review may be performed; implementing that update workflow is optional for this hackathon.

## Review record

Save the incident ID, inspection ID, product ID, evidence status, cited document IDs, revisions, PDF pages, decision, reviewer identity, review timestamp, and comment. Keep original model results and Round 2 reviews unchanged. Do not create another incident simply to record a review.

## Limits of approval

This dataset supplies no quantitative product acceptance limits, repair costs, customer waiver, scrap authorization, or release-to-shipment procedure. Questions requesting those details require information outside this reference set. The incident assistant must acknowledge that limitation.

A model confidence score is not a product acceptance rule. No confidence threshold in this procedure permits skipping Supervisor review or automatically clearing an item for shipment.
